

AI Usage Report

Course: SMD

Assignment:1

Student Name:Abdul Basit

Registration No.:23i-3018

Date: Oct 3, 2026

1. AI Tool(s) Used

List the AI tools used during the development of your application.

Example: ChatGPT, Gemini, GitHub Copilot

Response:

ChatGPT and Codex.

2. Purpose of AI Usage

Explain what you used AI for during the development of your application.

Examples:

- Understanding React/React Native concepts
- Debugging errors
- Generating or improving UI ideas
- Implementing charts using react-native-chart-kit
- Understanding unfamiliar code
- Improving code structure

Response:

- Understanding React/React Native concepts
- Debugging errors
- Generating or improving UI ideas
- Most of the coding

3. Important Prompts Used

Provide the important prompts that you gave to the AI tool.

Prompt 1:

I provided agents with markdown file with detailed instructions on how to implement each page instead of singular prompts.

A few examples of prompts are:

“tell me what are the core requirements that are a must so i design around that including them”

“So i was thinking of the following pages:

- 1) simple login page. (Has a logo i will provide) and conditionally renders login roll number and then password. if rollnumber isnt entered password doesnt show up. no need to be super secure we dont have to attach a db or anything this just shows conditional rendereing. we can have a dictionary with some dummy roll numbers and passwords.
- 2)A dashboard with charts as required. The charts can be from the attendance and marks portion of the app we will decide exact ones later.
- 3) An attendance portal that has attendance for all courses.
- 4) Register course page, that lets users register or drop courses. When a course is added it automatically updates the attendance and timetable pages.
- 5) A timetable page that uses the registered courses page to extract your timetable. Currently our university shares a googlesheet for the entire university, it has all sections all classes all courses and navigating might be a little hard. I want to make it so as user adds a course the timetable page updates and extracts their timetable and displays it for the entire week. If the implementation of extracting from googlesheet is too hard we can do some dummy timetables.
- 6) I want to add a lost and found page. Currently there is no system like this, there are some uni whatsapp groups but they are hectic and overfilled.

I want to design a page where the community can add pictures of something they found with a tag for place found in and date.

A student can also make a complaint/post of i lost this thing in this place if found pls contact. No need to overcomplicate it, one

page has already found items with a picture description, priority, date and a search feature or sort feature. The other page you can make a post of i lost this if found contact. user can add picture there as well. create a MD file with all this so i can start an agent on making the app. make the instructions super clear about all pages leave dashboard for now. For style use a white and light green theme. you can use pastel green for other places where required"

4. AI-Generated Output

Briefly describe the code, solution, or suggestion provided by the AI.

Response:

AI generated most of the code along with the documentation. I had to go back and refine them later on based on my preferences. For example on all the pages it added a "DUMMY DEMO APP" at the very bottom that i did not ask it to add.

5. Changes Made by Me

Explain what you changed, modified, or improved in the AI-generated solution.

Response:

AI followed common patterns for the pages and I had to go back and make some changes and fixes. Like aligning the pages to centre and removing unnecessary text from top and bottom of the pages. I also changed some implementation like student adding own attendance.

6. My Understanding

Explain the important part(s) of the AI-generated code in your **own words**.

Response:

The code generated by AI was mostly what we have learned in class. In some places it used some newer syntax to make it concise and more readable. The important parts were mostly reading arrays and making the elements appear inside views. I also used alot of conditional rendering instead of navigation.

7. Verification and Testing

Explain how you tested the AI-generated solution.

Mention:

- Whether the code worked correctly
- Errors encountered
- How you fixed the errors
- Any changes required after testing

Response:

Ran the app on phone and noticed the errors or parts i wanted changed. App was small enough for manual testing so i did only that. After this i asked AI to fix them.

8. Reflection

What did you learn from using AI during this assignment?

Response:

AI is a great tool to help you code but you have to keep it in check and also keep testing the application yourself. AI can add some stuff that you dont even ask it to so you have to keep an eye out for that and make sure your project is going according to your requirements.

Student Declaration

I confirm that I have used AI tools only as a development assistant and that I understand the code submitted as part of this assignment. I am able to explain and demonstrate the functionality of my application.
